

Umair Khan

AI Engineer Agentic Systems, LLM Evaluation & Automation

Lahore, Pakistan | umair992266@gmail.com | github.com/umair992266-dotcom | linkedin.com/in/umair-khan-3a546a418

PROFILE

AI engineer working across the full lifecycle of agentic systems, from LLM evaluation and fine-tuning through to production automation. Currently leads an AI POD focused on RLHF and supervised fine-tuning, and designed Terminal Bench (TB Harbor 2.0), an evaluation framework for agentic reasoning, along with a set of OSWorld benchmark tasks. Comfortable moving between research-adjacent work and hands-on engineering. Docker, pytest and proper documentation are just part of how the work gets done, not an afterthought.

TECHNICAL SKI LLS

LLM & Agents

Evaluation & Training Retrieval & Data Languages

Web & APIs

Engineering & Ops EXPERIENCE

LangChain, OpenAI API, tool use / function calling, RAG, prompt design, multi-step agent orchestration (n8n) Terminal Bench / TB Harbor 2.0, OSWorld, SWE-bench, RLHF, supervised fine-tuning

(SFT), task authoring, annotation QA FAISS, chunking and embedding strategy, ingestion pipelines, data annotation at scale
Python, JavaScript, SQL
React, Django, REST integrations (Salesforce, Slack, Notion, Google Maps)
Docker, Linux, pytest, Git / GitHub, CI, containerized reproducible environments

AI Automation Engineer Independent

Contract via Upwork Remote

Help businesses eliminate bottlenecks by building multi-step AI agents that connect CRMs, databases, Slack, and email automating decisions that used to take hours down to minutes.

My n8n workflows aren't just "if this, then that" they're agentic: the AI reasons, plans, and executes complex tasks before looping back for human approval or refinement.

Bring a deep AI engineering background as an AI POD Lead specializing in RLHF and Supervised Fine-Tuning (SFT).

Designed **Terminal Bench (TB Harbor 2.0)** and authored OSWorld Tasks to benchmark agentic reasoning.

Apply that same SWE rigor to every deployment containerizing with Docker, testing with pytest, and ensuring reliability so custom n8n agents integrate cleanly with a client's existing stack, cut headcount overhead on repetitive tasks, and hold up production workflows at scale.

SELECTED PROJECTS

AI Workflow Automator 2024 Python · LangChain · OpenAI API · Slack Webhooks · React

Built an agentic system that reads incoming Slack messages, classifies intent with an LLM, and routes each task to the right tool calendar, Notion, or email cutting down the manual triage that used to eat up the day.

Gave the agent real tool-use / function-calling access to external APIs, then kept iterating on the prompts until production accuracy passed 90%. Added a lightweight React UI so non-technical teammates could see what the agent was doing and step in when needed.

RAG-Powered Knowledge Base Q&A 2024 Python · LangChain · FAISS · OpenAI API · Docker

Built a retrieval-augmented pipeline that ingests internal docs, chunks and embeds them into a FAISS vector store, and answers natural-language questions with sources cited.

Tried out different chunking strategies and embedding models until hallucinations on domain-specific queries noticeably dropped. Open-sourced it with a one-command Docker setup now sitting at 50+ GitHub stars.

BizOps Dashboard 2023 React · Python · Salesforce REST API

Prototyped a dashboard pulling live data from the Salesforce REST API, surfacing pipeline metrics with automated anomaly flagging. Kept it scrappy on purpose, built v1 in a weekend, then refined it over three sprints based on what stakeholders actually needed.

EDUCATION

B.S. Computer Science

Virtual University of Pakistan

Relevant coursework: Machine Learning, Natural Language Processing, Distributed Systems, Data Engineering, Software
